

AUTOFADER II

The Malham Autofader II is designed to be a simple to operate colour-mixing controller for three or four colour DMX lighting displays. The Autofader produces four channels of DMX, starting at address 1. Although primarily designed to work in conjunction with the range of Malham DMX dimpacks, the Autofader can be used to control any DMX compatible equipment.

The Autofader front panel contains four brightness-control knobs, one for each of the colours: Red, green, blue and white. These can be used to combine different output levels of each primary colour to produce any desired colour. The Autofader can store up to nine of these static mixed colours, as well as ten pre-programmed cross-fades of up to ten colours. There is also a manual mode for choosing a colour live.

The Autofader can be wired with a DMX input from an external controller, and if a DMX signal is present this will take precedence enabling master – slave operation.
